Conference / Event, 2026

1. Introduction / Motivation

Write the problem in 3–6 lines. Posters should be readable quickly:

- What is the main goal?
- Why is it important?
- What is the challenge?

Example claim: we study the relationship $y = ax + b$ and estimate a, b from data.

2. Example

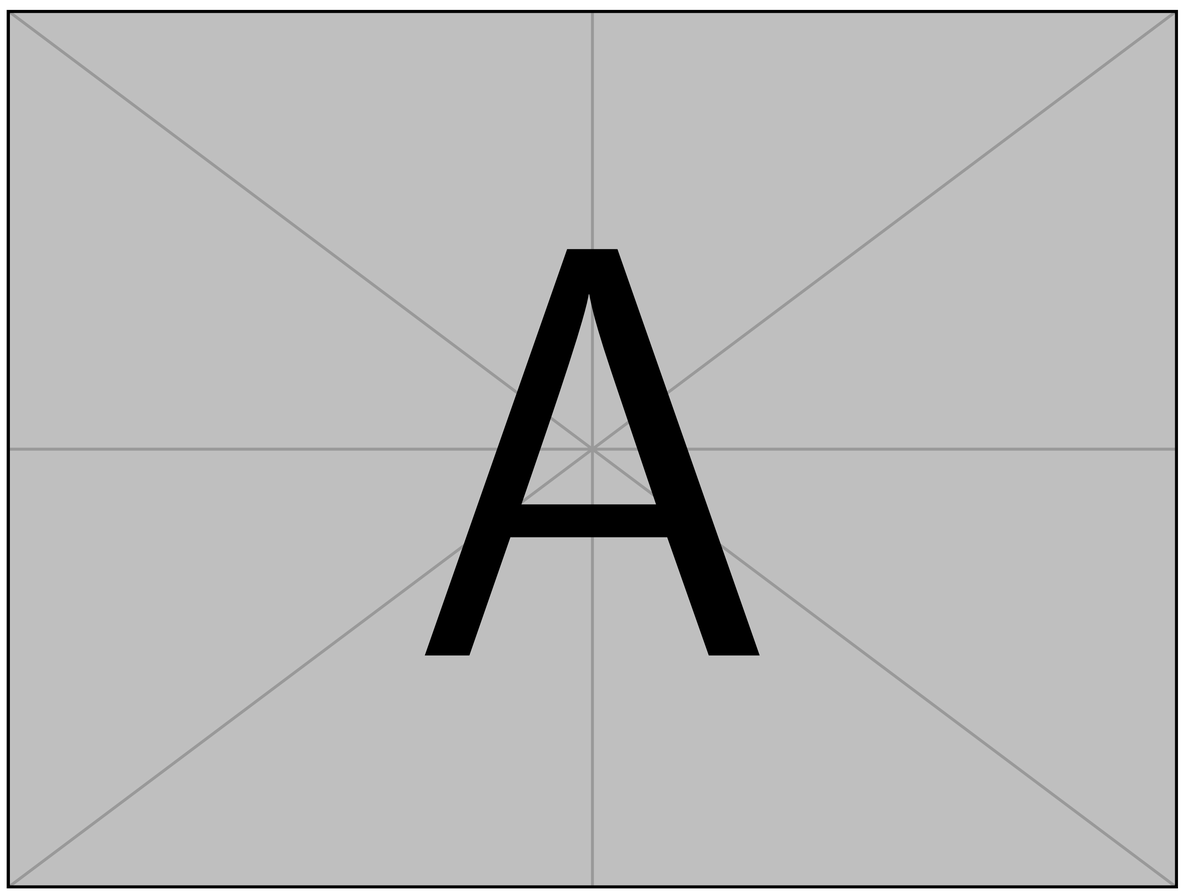
This is a boxed example using `exampleblock`.
Inline math: $a^2 + b^2 = c^2$.
A displayed equation:

$$\hat{a} = \arg\min_{a} \sum_{i=1}^{n} (y_i - a x_i)^2.$$

3. Method (Simple Steps)

Keep the method short and visual:

1. Collect data (x_i, y_i).
2. Fit parameters by minimizing loss.
3. Evaluate on a test set.



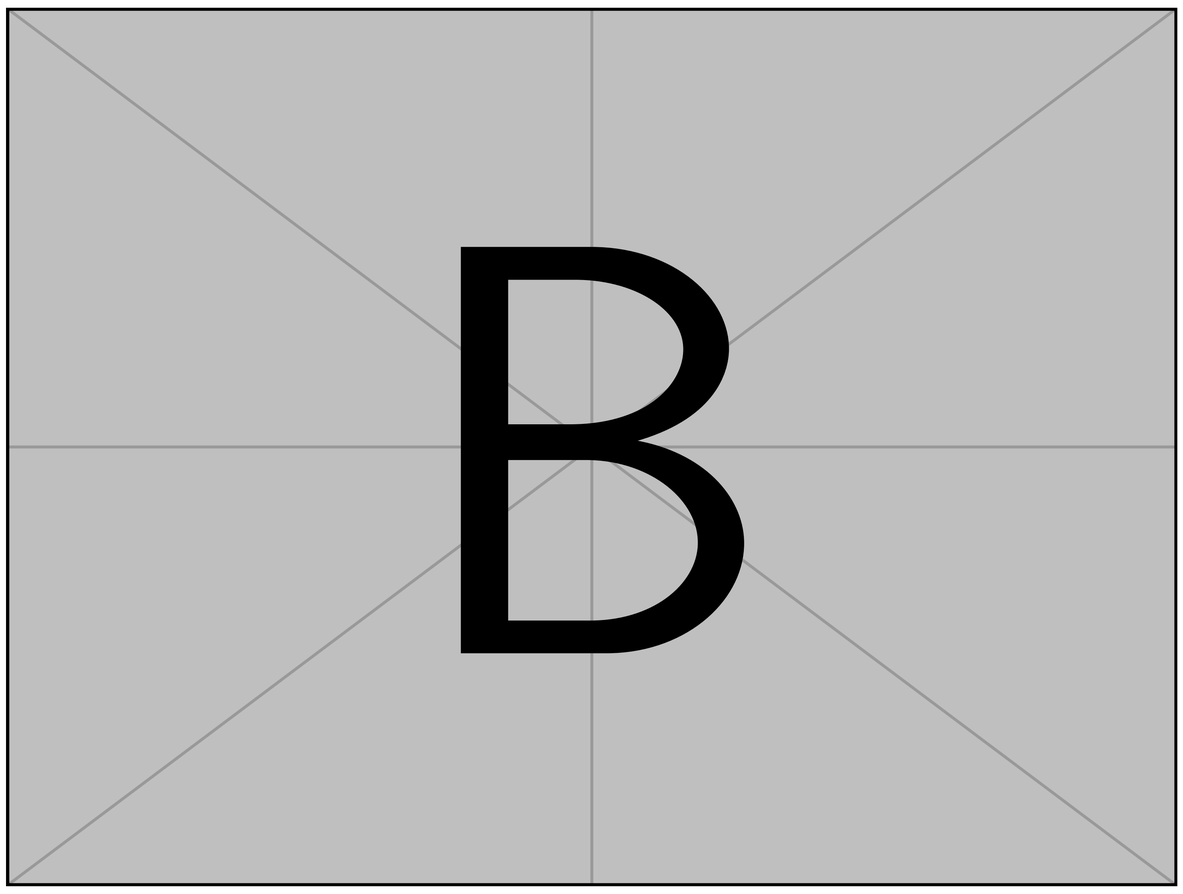
4. Key Contributions

- A simple approach that improves performance.
- A clean experimental design.
- Reproducible reporting with clear visuals.

5. Results (One Plot = One Message)

Make the main result obvious:

- Big axis labels in your plot.
- Thick lines, clear legend.



Headline: Our method improves accuracy by +6% over the best baseline.

6. Table (Optional, Clean Style)

Model	Score	Time (s)
Baseline A	0.81	12.4
Baseline B	0.84	15.1
Ours	0.90	10.2

Note: Keep tables small on posters. Use only key numbers.

7. Conclusion (Boxed Highlight)

- Main takeaway 1.
- Main takeaway 2.
- Limitation and future work.
